## **Microbus' market-leading vehicle computing division gets new website [www.incar-pc.org](http://www.incar-pc.org)**

Microbus has announced the launch of a new website [www.incar-pc.org](http://www.incar-pc.org) that is devoted to providing information for the fixed and demountable vehicle computer technologies that they offer and as source of mobile data market information.

Adding to their existing site, this dedicated website provides targeted information to help buyers of in-vehicle computer systems choose the right products and improve their vehicle mobile data and real-time video processing capability.

*"This new website has been developed to support our increasing vehicle technology offering and to let our customers know about the equipment we provide to support mobile data and real-time video applications."* says Richard Blake, Sales & Marketing Director.

When asked why [www.incar-pc.org](http://www.incar-pc.org) was designed and the benefits of doing it, Richard added *"We were keen to develop a website that was dedicated to informing visitors about our best in breed vehicle computing technology in an easy-to-navigate format. Our products are used all around the globe in a variety of sectors and we want visitors to know which product best suits their application whether it be for public safety, transportation, or commercial use. We also have a stream of exciting new in-car computer products that we will be launching soon and this site will provide the ideal platform."*

Microbus have stated that they would welcome any feedback on the new site from users and plan to constantly update and refresh the pages to keep visitor's interest.

### Editors Notes:

Microbus plan to develop the site further in the coming months to promote their products better to end users, fleet managers and ICT managers through promotion centred on the new [www.incar-pc.org](http://www.incar-pc.org) website.

The Microbus range of products already forms the hardware core of many well known industry 'names' intelligent systems. The network of Microbus Value Added Partners (VAPs) is expanding world-wide and the company has achieved recent success in the deployment of 1000s of Microbus systems to the Middle East alongside new installations and technology refreshes for many UK Emergency Services customers. Over 80% of UK police forces currently operate Microbus computing and/or camera equipment.

The website includes clear calls to action for easy browsing and if any further technical information is needed there is a direct technical support number and contact information given on each page.
